STOT - single exposure No data available

STOT - repeated exposure Muhle et al. reported pulmonary response upon chronic inhalation exposure in rats to a

toner enriched in respirable-sized particles compared to commercial toner. No pulmonary change was found at 1 mg/m³ which is most relevant to potential human exposure. A minimal to mild degree of fibrosis was noted in 22% of the animals at 4 mg/m³, and a mild to moderate degree of fibrosis was observed in 92% of the animals at 16 mg/m³. These findings are attributed to "lung overloading", a generic response to excessive

amounts of any dust retained in the lung for a prolonged interval.
